

Lab 3: Deadline week 5

1. Write the query for the questions below and save it in lab3.sql file.
2. Download the database schema from the Teams group. Open your DBMS (such as DataGrip or pgAdmin) and run the schema file to create the database with the tables. (The instruction is provided in the video recording).
3. Retrieve the first and last names of staff from **staff** table who are currently active but do not have a picture stored.
4. List the titles of all films from the **film** table with their lengths, but only include films longer than 50 minutes. Sort the results by length from longest to shortest.
5. Find all films with a length between 100 and 110 minutes that have a rating of 'G' from the **film** table. The result should be ordered by length in ascending order.
6. Show title, rating, length. Sort by rating A to Z, and inside each rating by length from longest to shortest.
7. From the rental table, show rental_id and return_date. Newest return_date first, and rentals not returned yet (NULL) at the end.
8. Find the minimum film length for every rating in the **film** table.
9. Show the film title in upper case and the film length in hours. Name the columns title_upper and length_hours.
10. Show the longest film for each rating (title, rating, length). If two films have the same length, show the first title in A to Z order. (Hint: use DISTINCT ON)
11. Find each unique set of special_features with the total sum of rental rates of all films from the **film** table that have those features.
12. Find the number of films in each rating category from the film table. Only display the categories that have more than 200 films.
13. Find all first names and last names of the actor and staff from actor and staff tables. Use UNION.
14. Do Q13 again with UNION ALL. Which one gives more rows, UNION or UNION ALL?
15. Select the first name and last name of actors who do not exist in the staff table.
16. Using INTERSECT, list the titles of films with length greater than 100 and replacement_cost less than 25.
17. Show each different rating value from the film table.
18. Skip the first 10 longest films and show the next 5. If two films have the same length, sort by title A to Z.
19. Count the films for each rating, but only films longer than 100 minutes. Show only the ratings that have more than 110 such films.
